

ADVANCED DIGITAL DESIGN OF PHARMACEUTICAL THERAPEUTICS

First Principles Models for Particle and Process Design

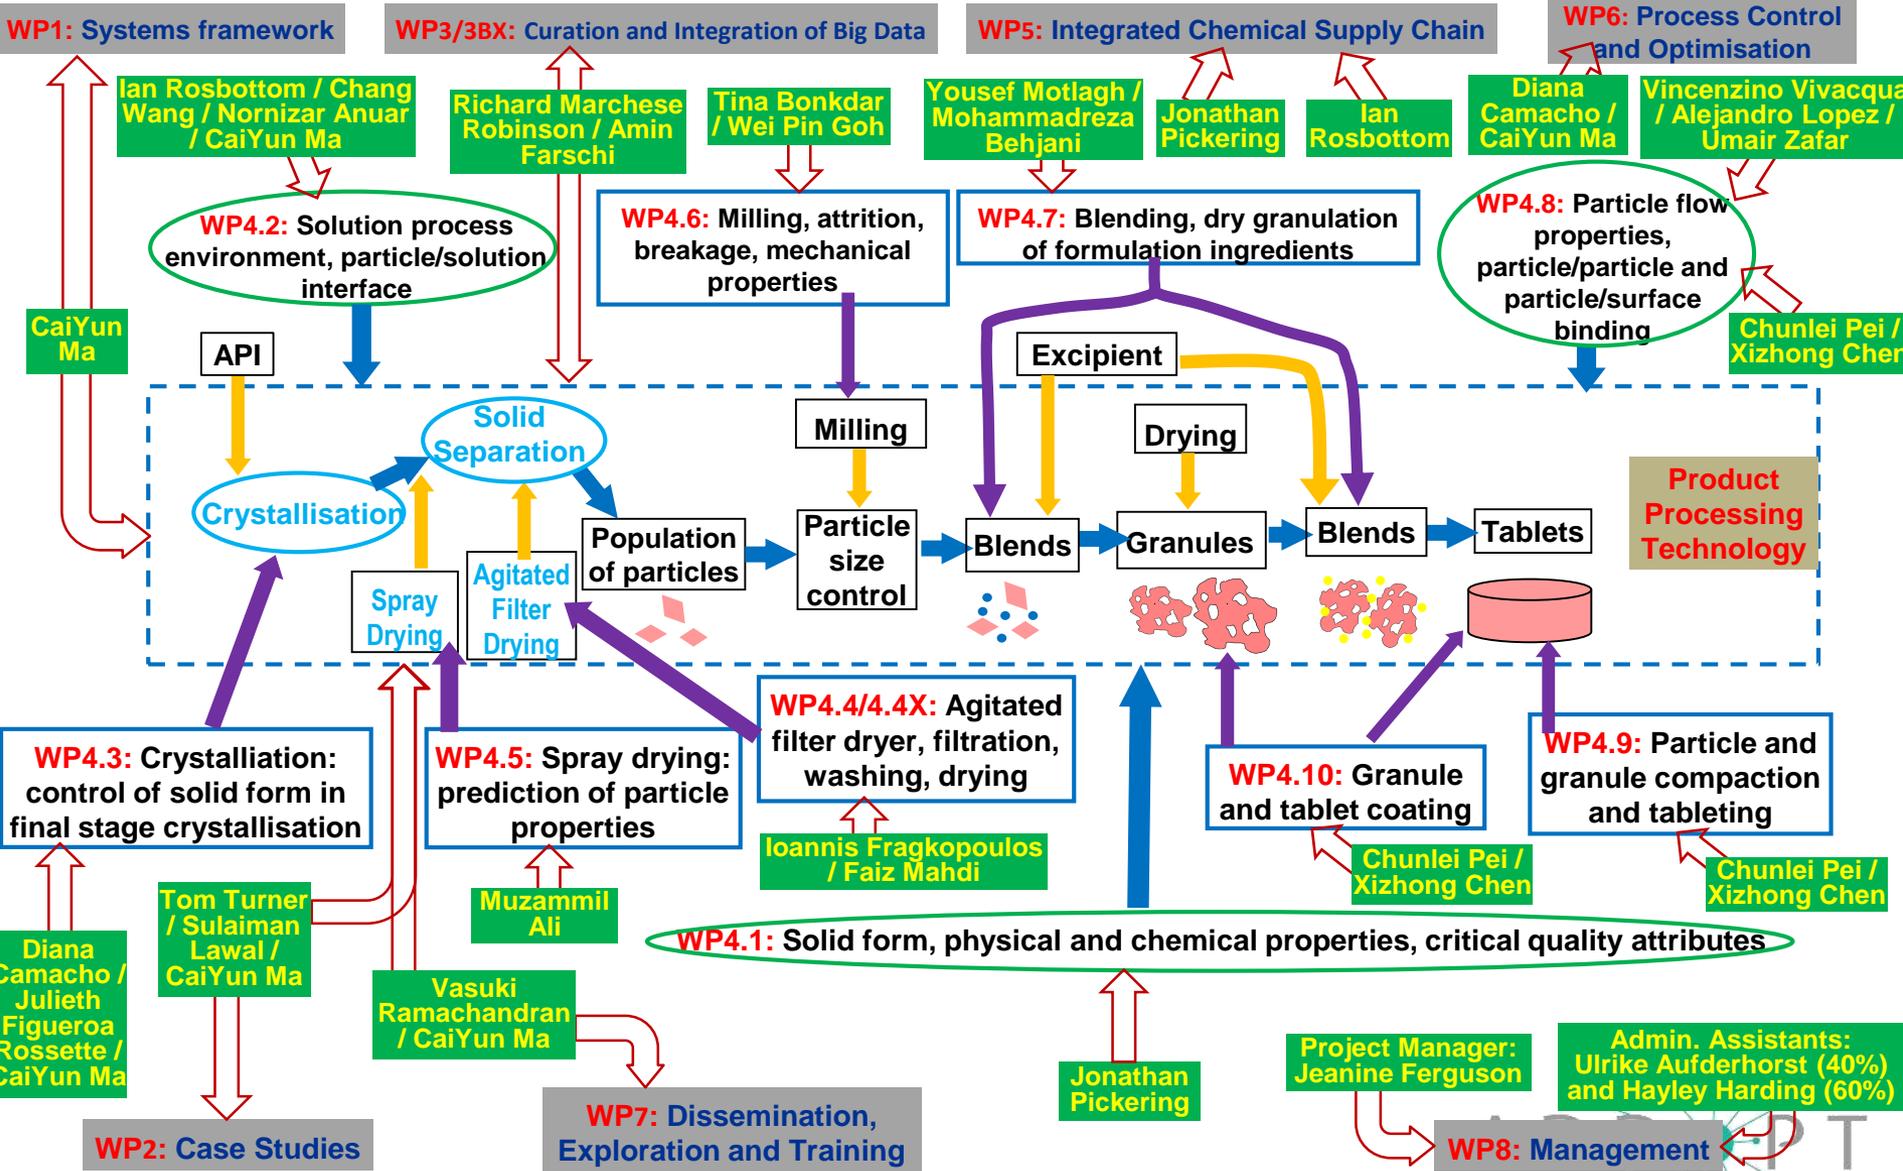

Kevin J. Roberts

School of Chemical and Process Engineering

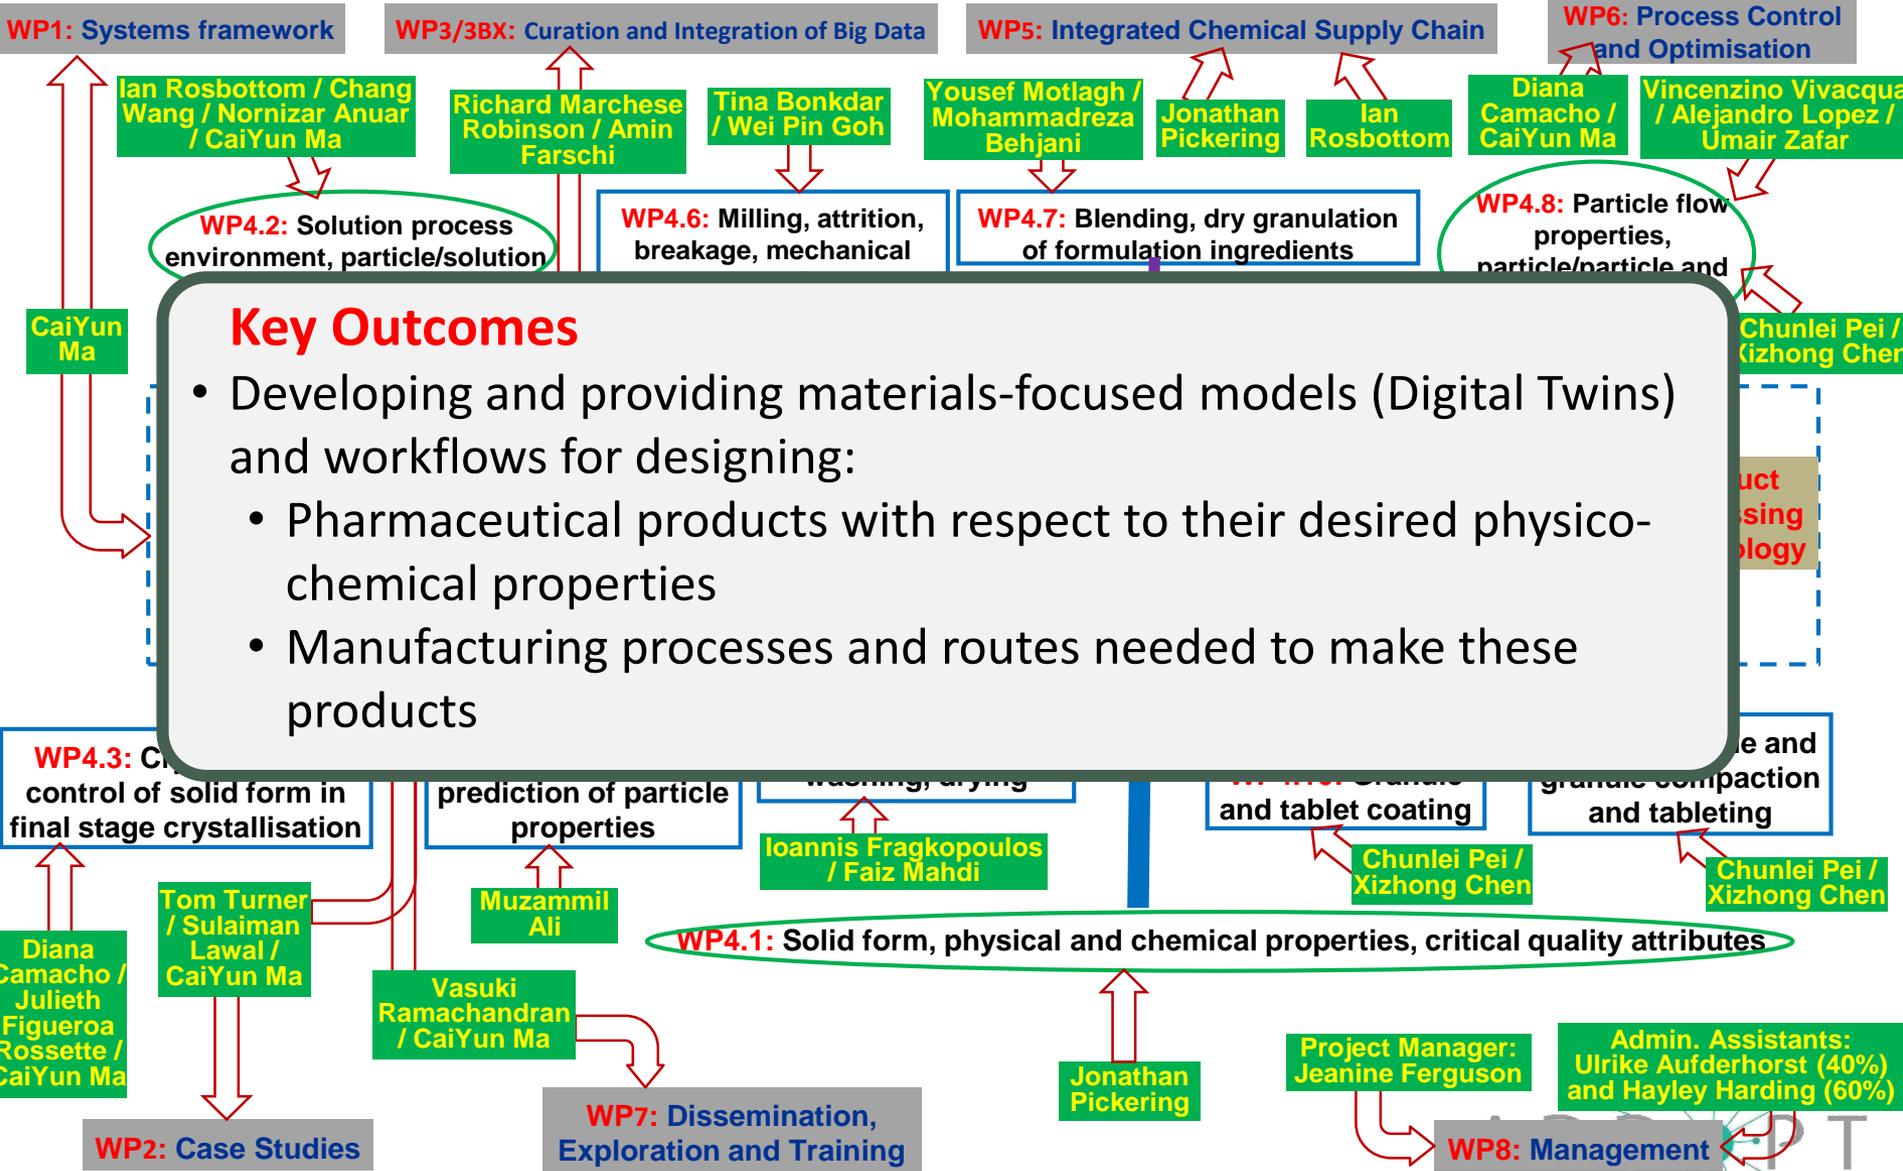

University of Leeds

Work Programme 4: Development of 1st Principles Models for Pharmaceutical Materials (24 researchers in total)

Work Programme 4: Development of 1st Principles Models for Pharmaceutical Materials (24 researchers in total)

Key Outcomes

- Developing and providing materials-focused models (Digital Twins) and workflows for designing:
 - Pharmaceutical products with respect to their desired physico-chemical properties
 - Manufacturing processes and routes needed to make these products

VisualHabit: Predicting the Morphology of α -Lactose

WP 4.1: J. Pickering, I. Rosbottom, H. Nguyen, R. Hammond and K. Roberts

4

- VisualHabit a platform for calculating the lattice energy of organic crystals, predicting their morphology, and investigating the synthons generating the morphology.

Predicting Solvent Mediated Morphology of Ibuprofen

WP 4.1: J. Pickering, I. Rosbottom, R. Hammond and K. J. Roberts

- VisualHabit/SystSearch a platform for faceted crystal particle design

Key Outcomes

- Crystal morphology and surface chemistry predicted on the basis of crystallographic structure
- Grid-based calculations characterize crystal surface/solvent interactions
- Ratios of the growth rates of ibuprofen surfaces providing a guide for industrial solvent selection

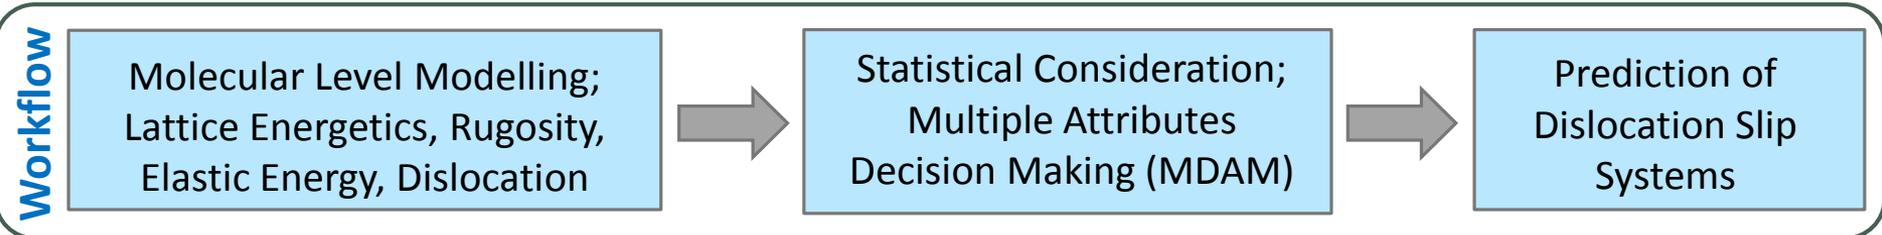

Rosbottom I, Pickering J, Etbon B, Hammond R and Roberts K, "Examination of inequivalent wetting on the crystal habit surfaces of RS-ibuprofen using grid-based molecular modelling", Physical Chemistry Chemical Physics, 2018, Vol. 20, Num. 17, DOI: 10.1039/c7cp08354h

Tablet Compaction: Prediction of Mechanical Properties

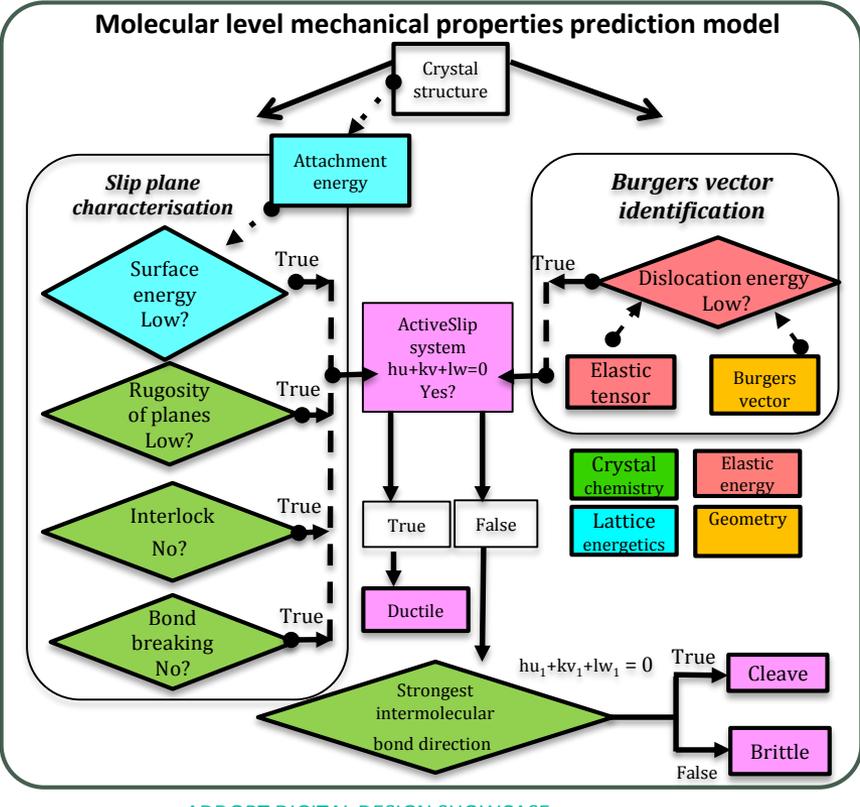

WP 4.1: S. F. Ibrahim, J. Pickering, V. Ramachandran, K. J. Roberts

- Enabling solid form design for direct compression through crystallographic structure analysis for prediction of API mechanical properties

Tablet Compaction: Prediction of Mechanical Properties

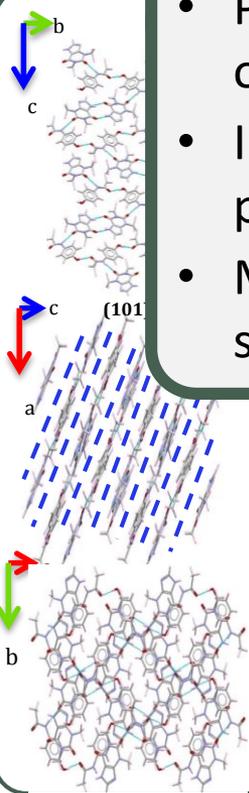

WP 4.1: S. F. Ibrahim, J. Pickering, V. Ramachandran, K. J. Roberts

- Enabling solid form design for direct compression through crystallographic structure analysis for prediction of API mechanical properties

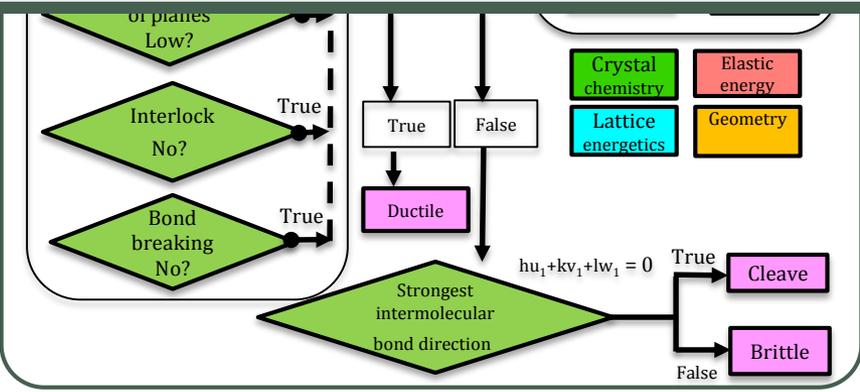

Key Outcomes

- Prediction of influence of molecular and crystallographic structure on mechanical properties of crystals
- Introduction of rugosity and interlocking of planes to enhance prediction of mechanical properties
- Mechanical properties based design tool useful in solid-form selection for direct compression

Optimisation of API particles attributes in batch crystallisers

WP 4.3: D. M. Camacho, J. A. Figueroa Rosette, C. Y. Ma, T. Mahmud and K. J. Roberts

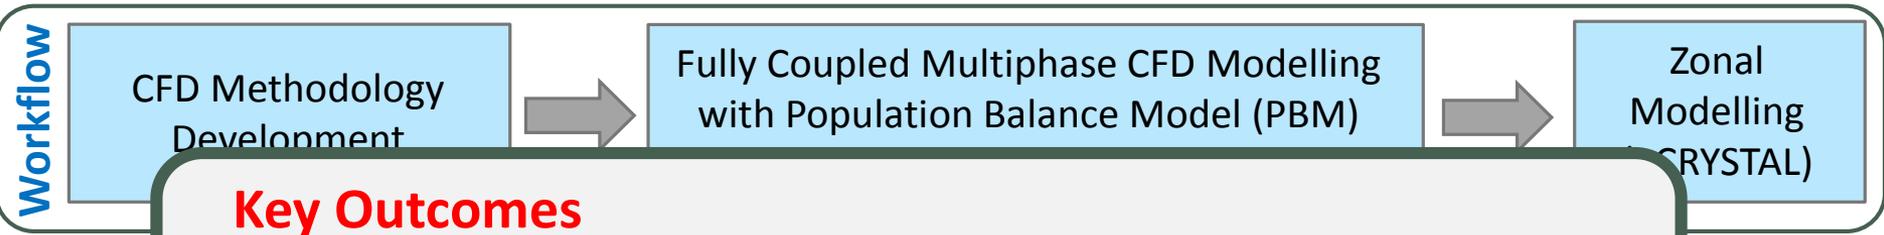

- Models were developed to assess hydrodynamics and evolution of CSD in a 20-Litre jacketed crystalliser with a retreat impeller and a single baffle

Optimisation of API particles attributes in batch crystallisers

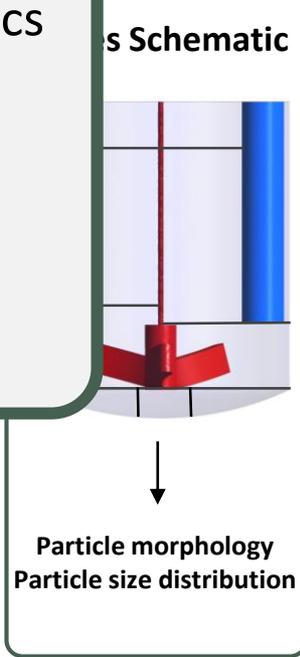

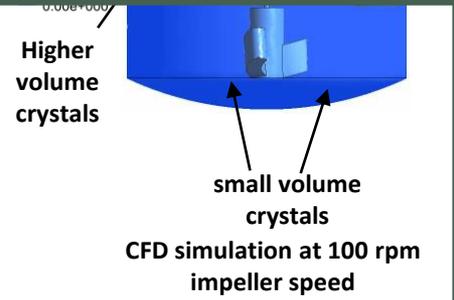

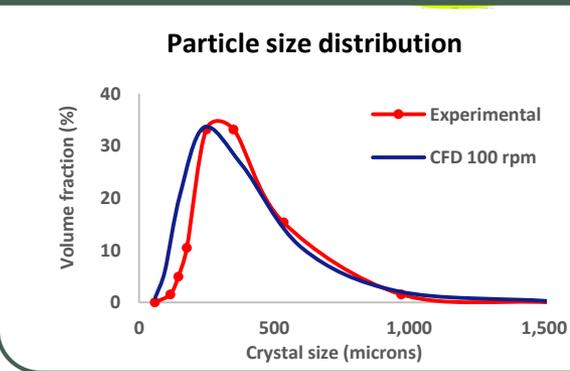

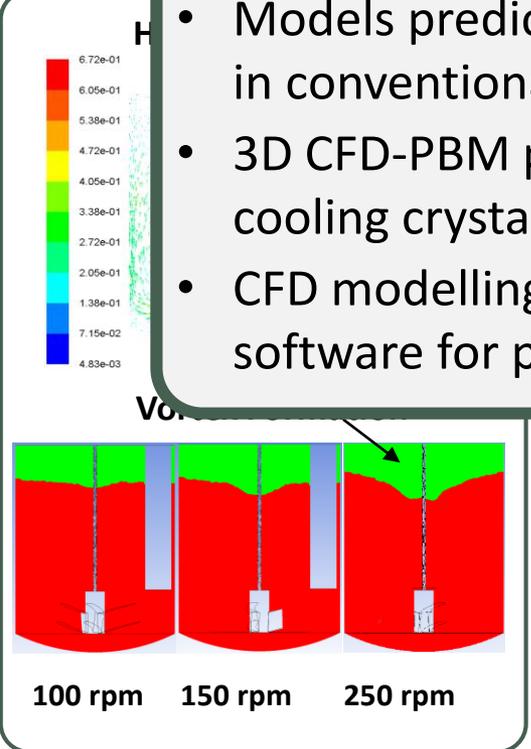

WP 4.3: D. M. Camacho, J. A. Figueroa Rosette, C. Y. Ma, T. Mahmud and K. J. Roberts

- Models were developed to assess hydrodynamics and evolution of CSD in a 20-Litre jacketed crystalliser with a retreat impeller and a single baffle

Key Outcomes

- Models predict effect of operating conditions on hydrodynamics in conventional pharmaceutical crystalliser
- 3D CFD-PBM predicts the evolution with time of CSD in batch cooling crystallisation
- CFD modelling results can be used into multi-zonal modelling software for process optimisation

Investigation of Crystal Breakage during Pressure Filtration

WP 4.4X: F. Mahdi, I. Fragkopoulos and F. Muller

- To validate a Crystal Breakage Model, three methods have been developed for investigating the crystal breakage experimentally: continuous pressure percolation, AFM and XRT scan

Key Outcomes

- Effect of pressure Filtration/Percolation on high aspect ratio crystals
- Mechanical properties of single organic crystals using AFM to calculate Tensile strength and Young's modulus
- Visualisation of packed bed structure of organic crystals to validate a 3D DEM Packed Bed Structures

Spray Drying: Prediction of Particle Properties

WP 4.5: M. Ali, T. Mahmud, P. J. Heggs and A. E. Bayly

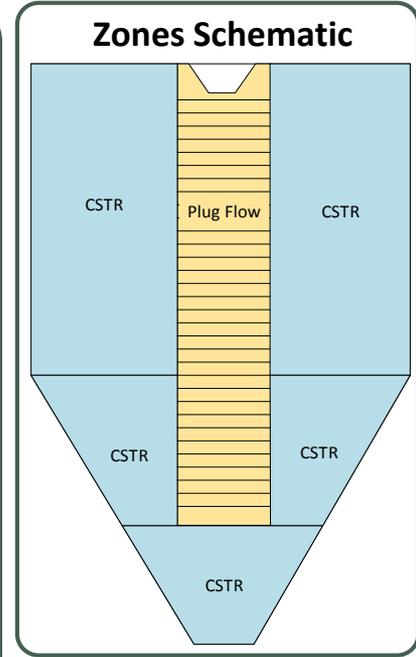

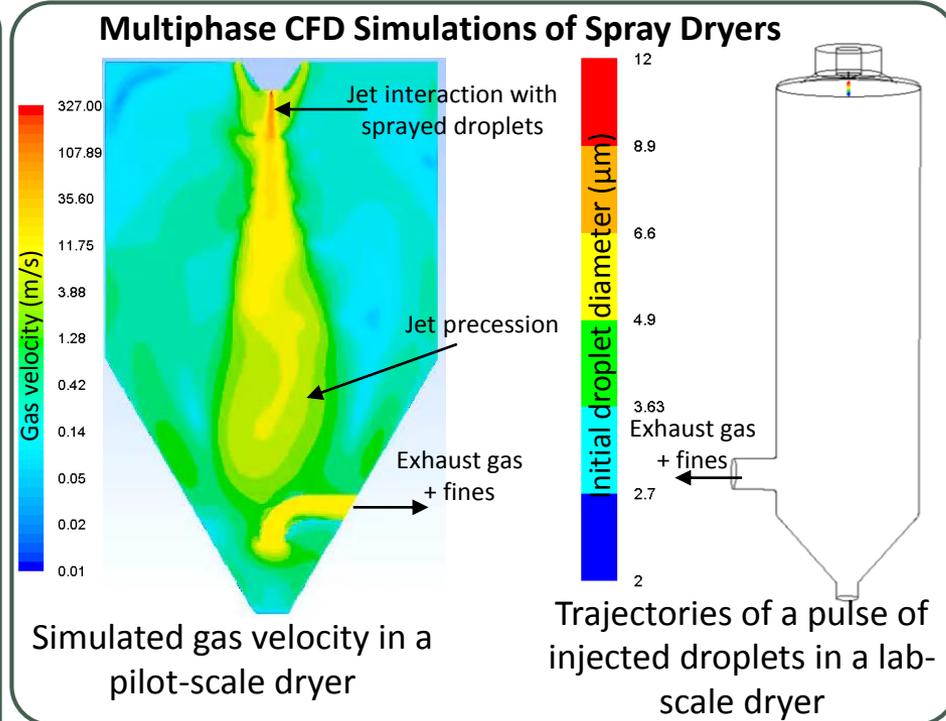

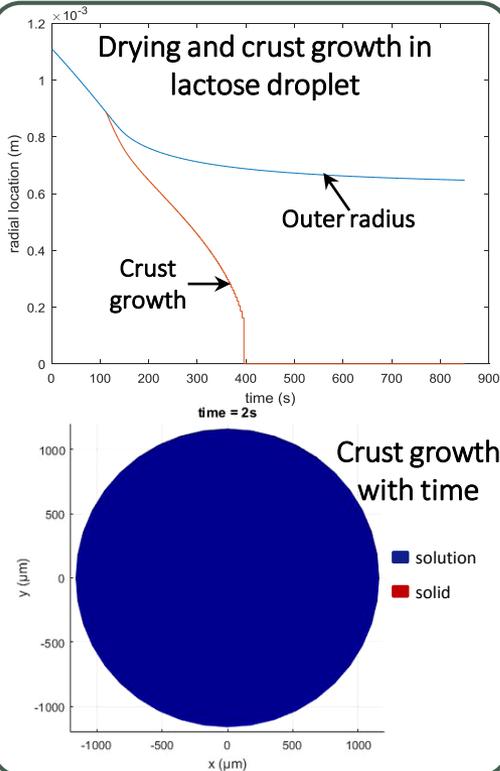

- Droplet drying models were developed and coupled with CFD models to gain better understanding of spray drying pharmaceutical materials

Workflow

Single Droplet Drying Models for Amorphous and Crystalline Materials

Multiphase CFD Modelling of Lab and Pilot-Scale Dryers (Fluent)

Zonal Modelling (gSOLIDS)

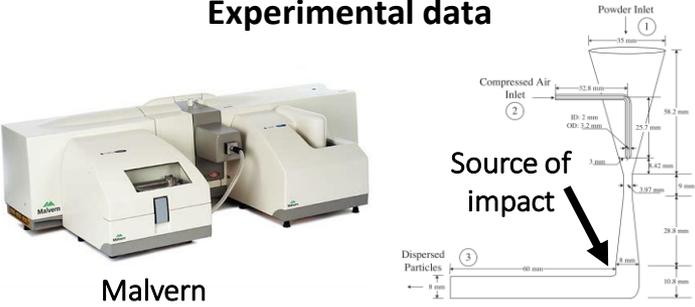

Breakability Assessment of Pharmaceutical Materials

WP 4.6: W. P. Goh, T. Bonakdar and M. Ghadiri

- Novel method was developed to assess the breakability of pharmaceutical materials using aerodynamic dispersion technique

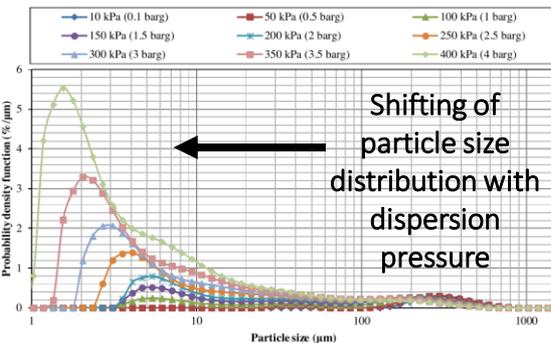

Experimental data

Malvern Mastersizer 2000 (commercial)

Scirocco Disperser Unit

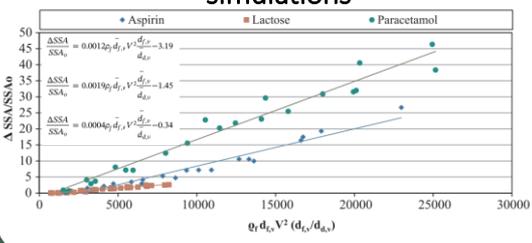

Particles are dispersed at different dispersion pressure, causing different degrees of breakage

Shifting of particle size distribution with dispersion pressure

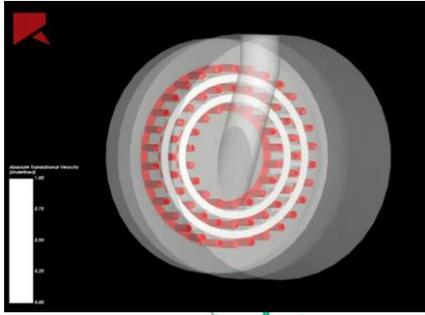

Breakability Assessment

- Breakage is expressed in terms of shift of specific surface area
- Slope of the fitted line, $\alpha H/K_c^2$ gives a measure of the breakability of the material
- Breakage Kernel gives a measure of how much energy is required to induce certain degree of breakage and that information can be used to analyse the breakage behaviour in the DEM simulations

DEM Simulation

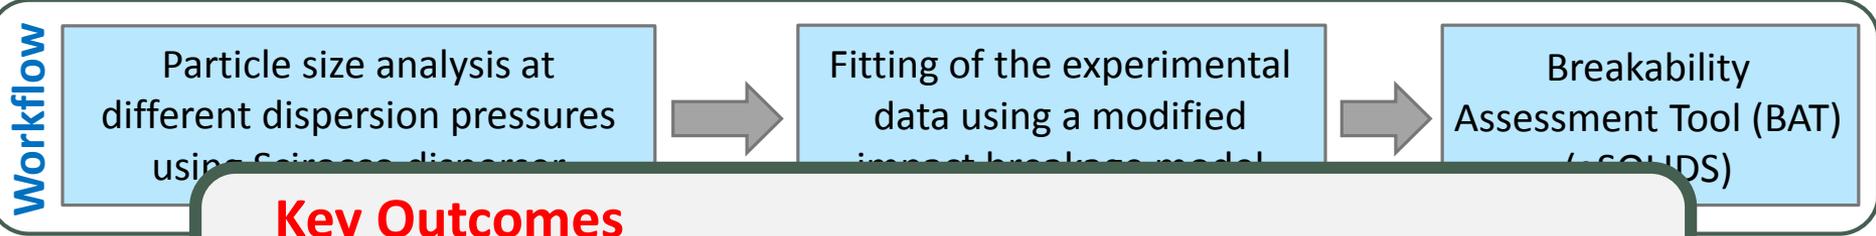

- Real particle shape is used to simulate pin milling of pharmaceutical materials
- Faceted Polyhedron with 26 faces
- Breakage model available and the parameters can be calibrated using the breakage kernel

Breakability Assessment of Pharmaceutical Materials

WP 4.6: W. P. Goh, T. Bonakdar and M. Ghadiri

- Novel method was developed to assess the breakability of pharmaceutical materials using aerodynamic dispersion technique

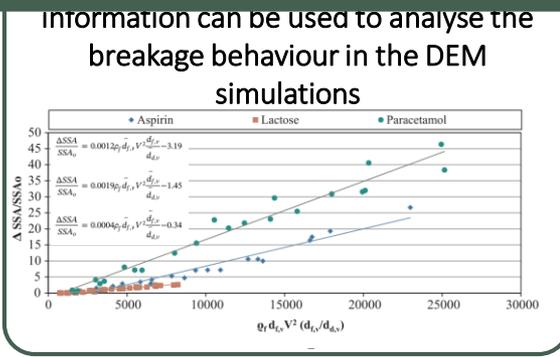

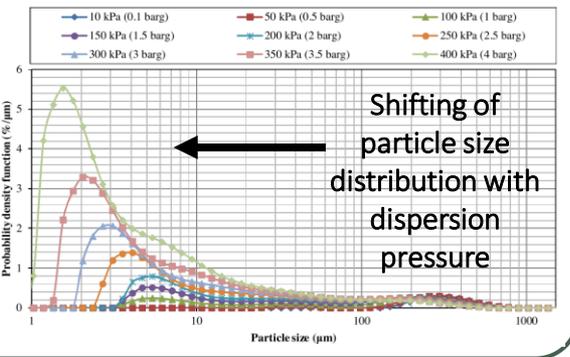

Key Outcomes

- Model predicts the breakability of materials
- BAT model has been implemented in gPROMs, simplifying the analysis of the experimental data
- The performance of pin mill is simulated and investigated using DEM

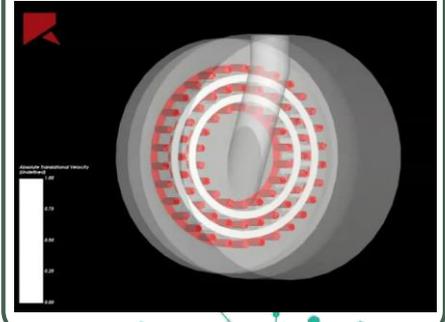

Malvern Mastersizer (commercial)

Particles are dispersed at different dispersion pressure, causing different degrees of breakage

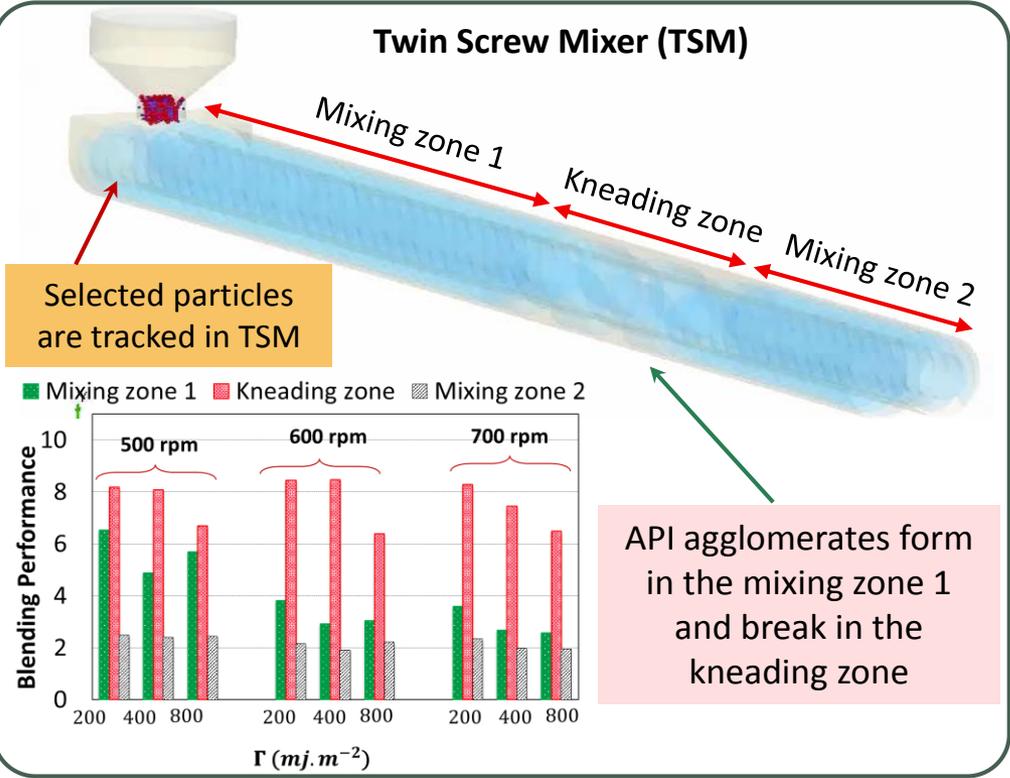

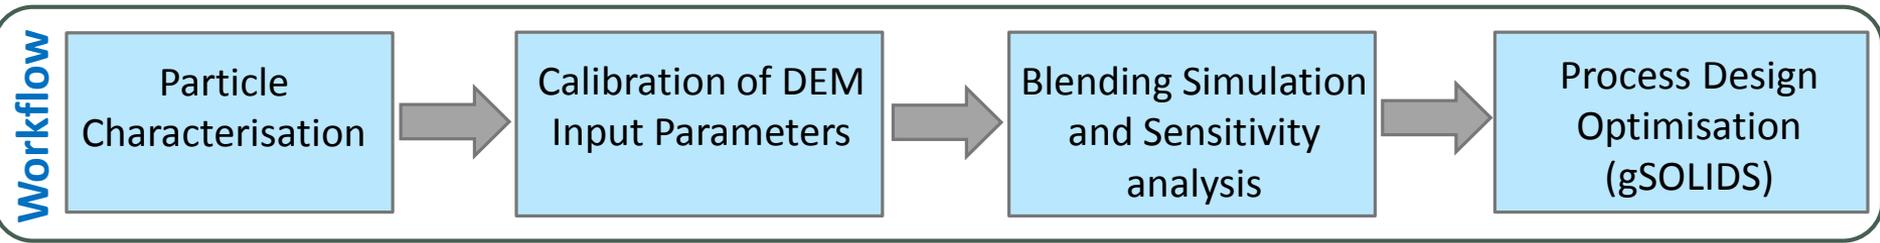

Simulation
 This is used for the milling of pharmaceutical materials. The simulation is done with a DEM model. The model is available and can be calibrated using a kernel.

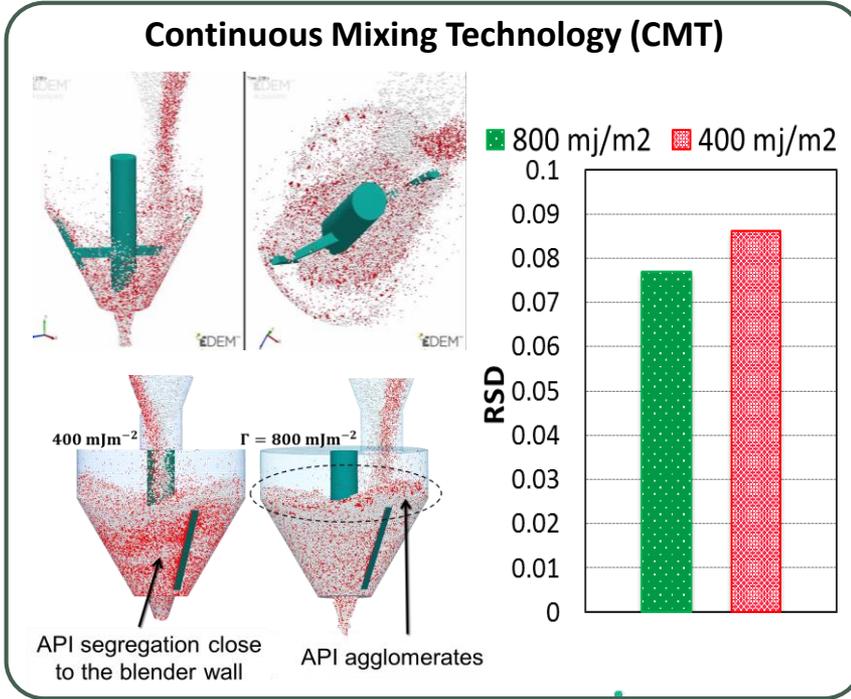

Continuous Blending: Prediction and Assessment

WP 4.7: M. A. Behjani, A. Hassanpour and A. E. Bayly

- Discrete Element Method (DEM) is used to predict continuous blending of pharmaceutical powders and optimise the process design

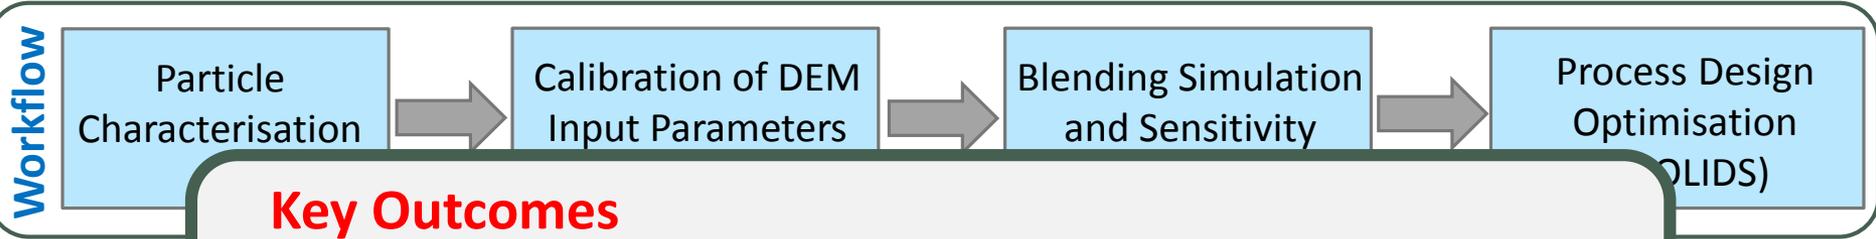

API agglomerates form in the mixing zone 1 and break in the kneading zone

Continuous Blending: Prediction and Assessment

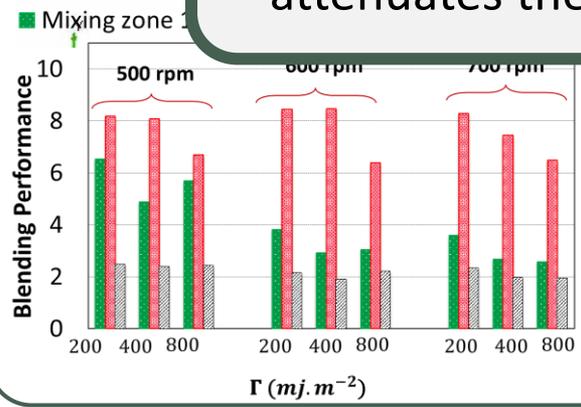

WP 4.7: M. A. Behjani, A. Hassanpour and A. E. Bayly

- Discrete Element Method (DEM) is used to predict continuous blending of pharmaceutical powders and optimise the process design

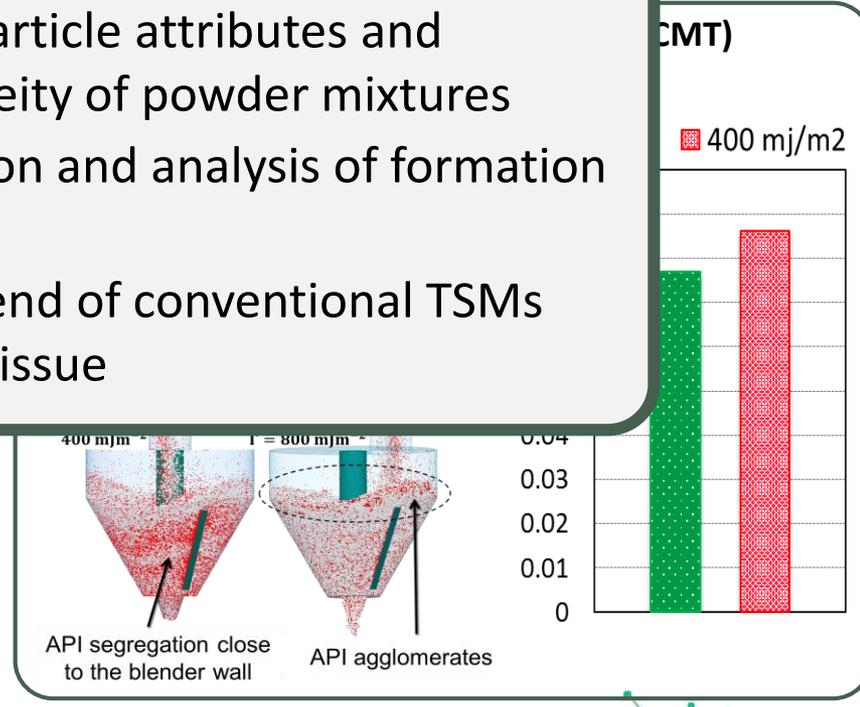

Key Outcomes

- Simulations predict influence of particle attributes and operating conditions on homogeneity of powder mixtures
- DEM modelling facilitates prediction and analysis of formation of undesired API agglomerates
- Adding a kneading section to the end of conventional TSMs attenuates the API agglomeration issue

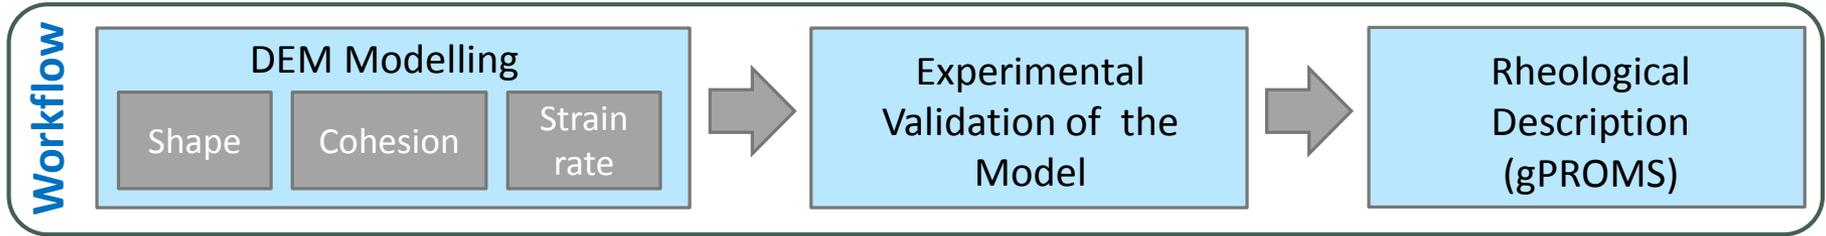

API agglomerates form in the mixing zone 1 and break in the kneading zone

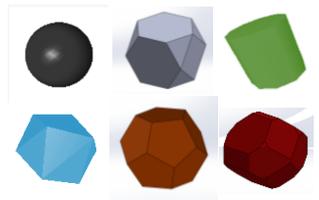

Prediction of Cohesive Powder Flow under Dynamic Conditions

WP 4.8: U. Zafar, A. Lopez, V. Vivacqua, R. Hammond and M. Ghadiri

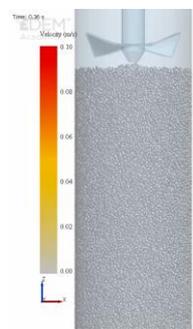

- Numerical simulation by DEM is used to develop a unified rheological description of flow of cohesive and faceted particles in Freeman Technology FT4 rheometer and screw feeder

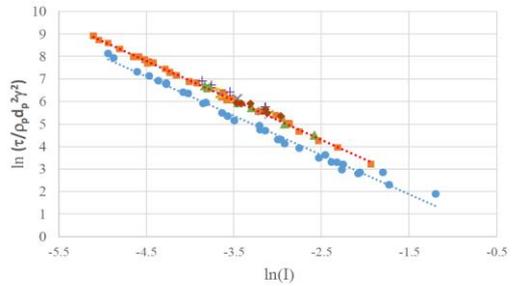

- Cohesive faceted particles have been derived from DEM simulations.

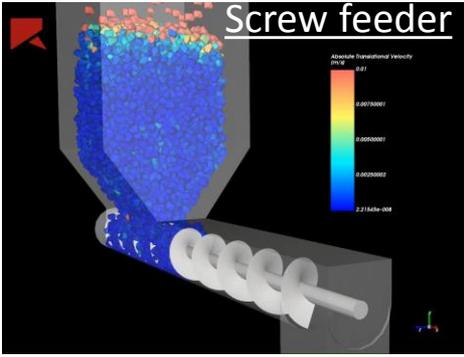

- Two different equations have been developed for dynamic powder flow behaviour.

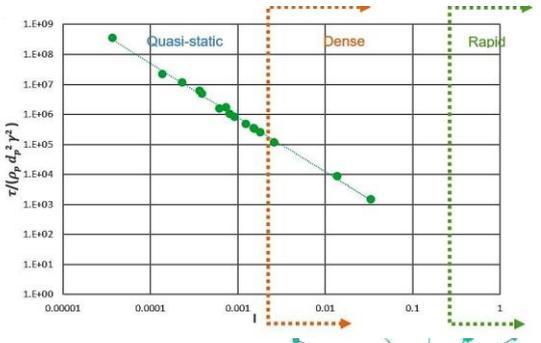

FT4 rheometer

● spheres 2 mm ● Deltahedra 2 mm ● Dodecahedra 2 mm
+ Faceted cylinder 2 mm ▲ Paracetamol 2 mm × Truncated Polyhedra 2 mm
◆ Truncated cube 2 mm

Screw feeder

Prediction of Cohesive Powder Flow under Dynamic Conditions

WP 4.8: U. Zafar, A. Lopez, V. Vivacqua, R. Hammond and M. Ghadiri

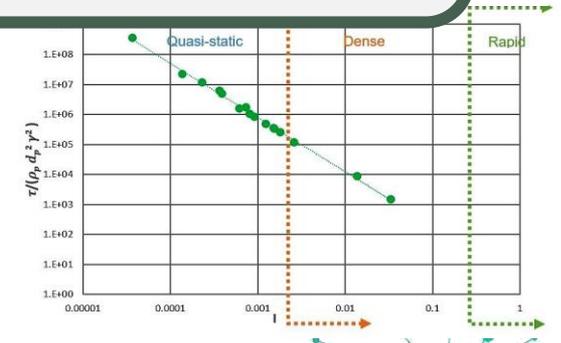

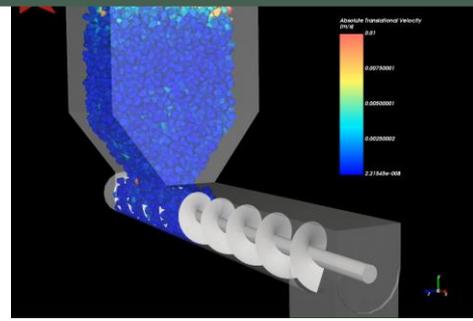

- Numerical simulation by DEM is used to develop a unified rheological description of flow of cohesive and faceted particles in Freeman Technology FT4 rheometer and screw feeder

Key Outcomes

- The ability to predict accurately how a new API will flow in the devices used for its processing to minimize manufacturing issues
- The research will impact the powder processes and design of new processes for the pharmaceutical industry
- The research can be merged in commercial software (PSE) and improve the current models used for predicting powder flow

- Two different equations have been developed for dynamic powder flow behaviour.

Mechanistic Powder Flow Models: Flowability Prediction

WP 4.8: C. Pei, X. Chen and J. Elliott

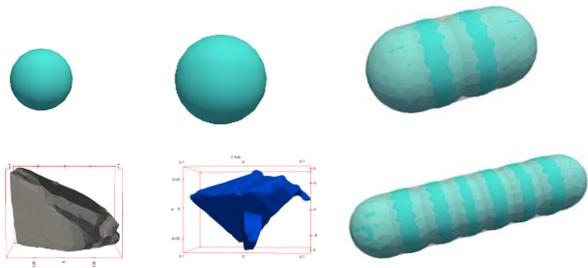

- Aim: to combine DEM and DoE to understand of the effect of changing particle shape and/or cohesive interactions on flowability of pharmaceutical powders

Workflow

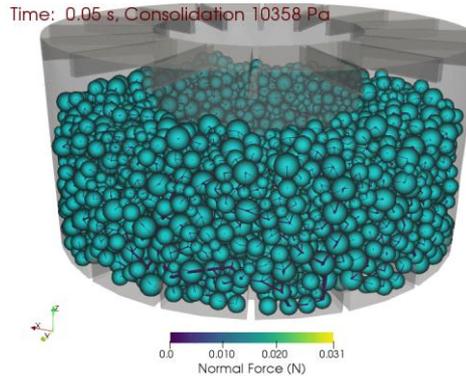

Design of experiments: flowability responses on particle size, shape, elasticity and surface energy

Discrete element modelling of particle dynamics in ring shear cell tester

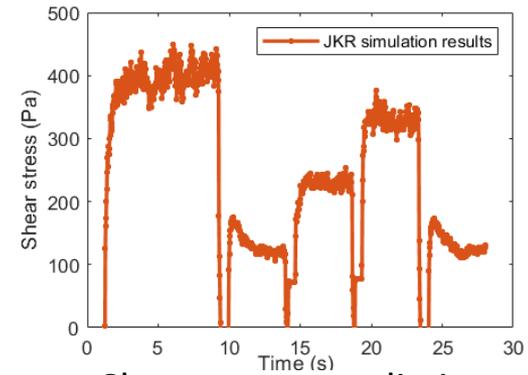

Reduced model/relationship for flowability, bulk cohesion

Particle properties

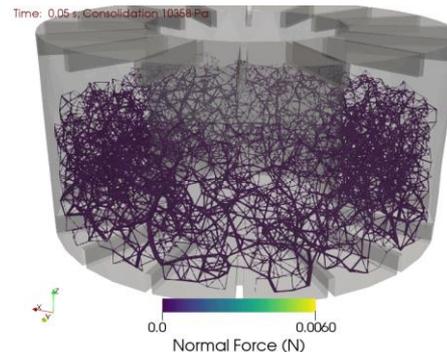

DEM simulation of ring shear cell

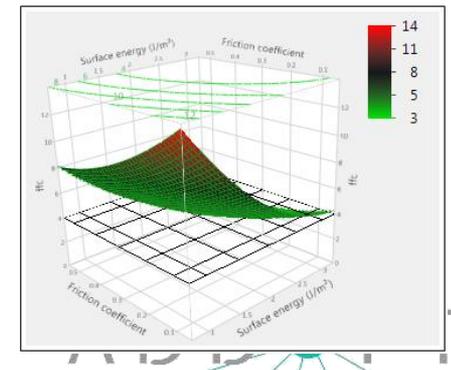

Shear curve prediction

Schulze ring shear cell test

Contact network from simulation

Flowability (ffc) prediction

Mechanistic Powder Flow Models: Flowability Prediction

WP 4.8: C. Pei, X. Chen and J. Elliott

- Aim: to combine DEM and DoE to understand of the effect of changing particle shape and/or cohesive interactions on flowability of pharmaceutical powders

Workflow

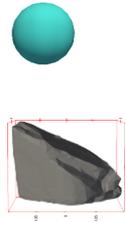

Design of experiments: flowability responses on particle size, shape, elasticity and surface energy

Discrete element modelling of particle dynamics in ring shear cell tester

Reduced model/relationship for flowability, bulk cohesion

Key Outcomes

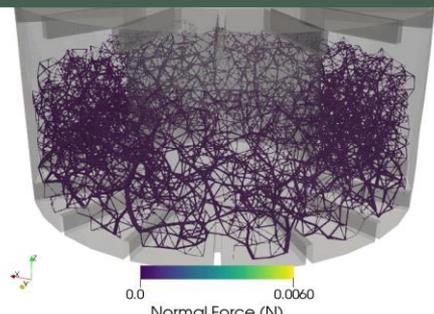

- Powder flowability was characterized by the ring shear test and predicted using discrete element method
- The effects of powder shape, size, friction, surface energy, on flowability and internal friction angle were studied
- Simplified models for flowability, internal friction angle and bulk cohesion were built for process optimization

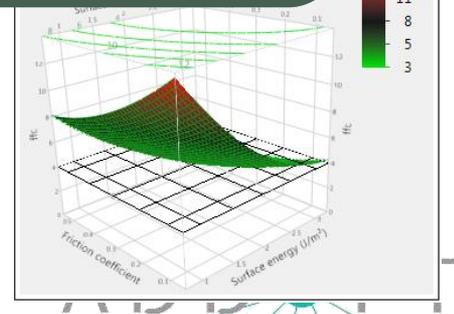

Part

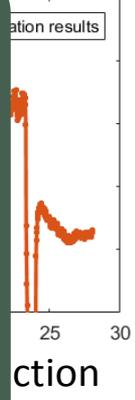

Schulze ring shear cell test

Contact network from simulation

Flowability (ffc) prediction

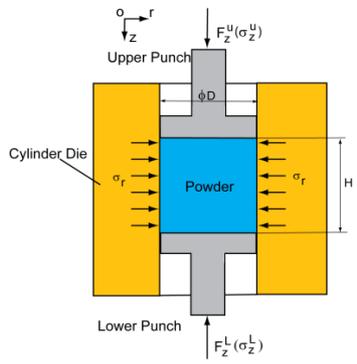

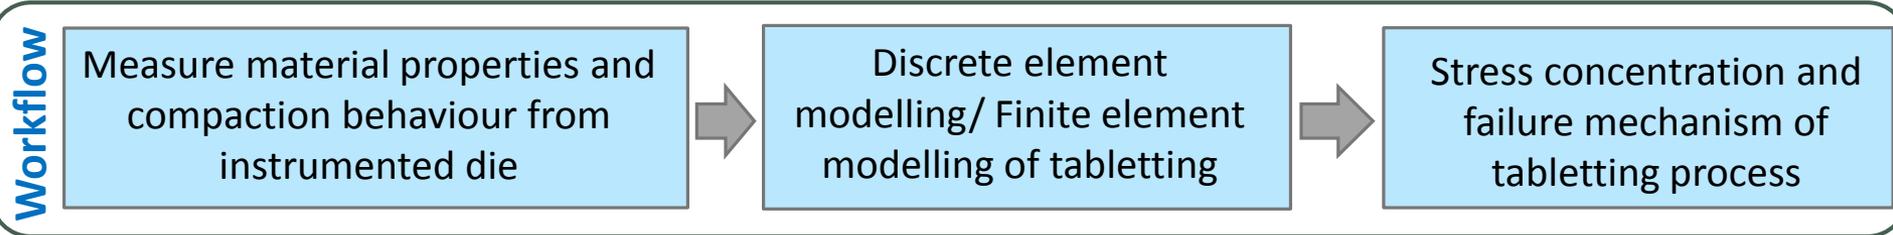

ction

Granule Compaction and Tableting Models

WP 4.9: C. Pei, X. Chen and J. Elliott

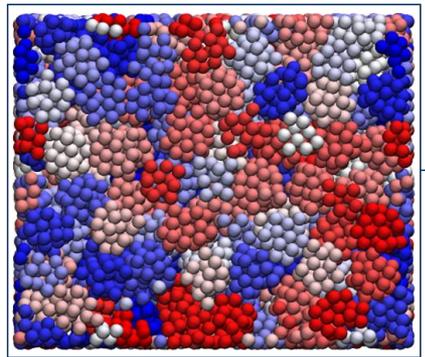

- Aim: to translate data from compaction simulator into FEM/DEM for tablet compaction and understand the ability of both blended and granulated powders to form stable compacts

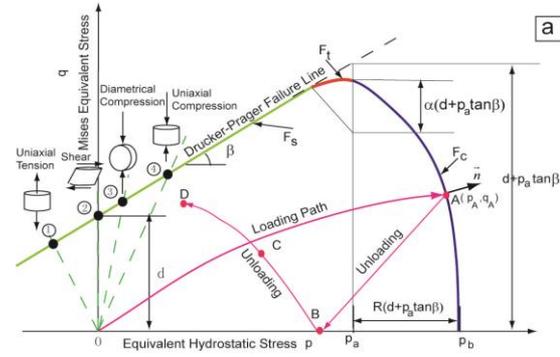

Instrumented die for tableting

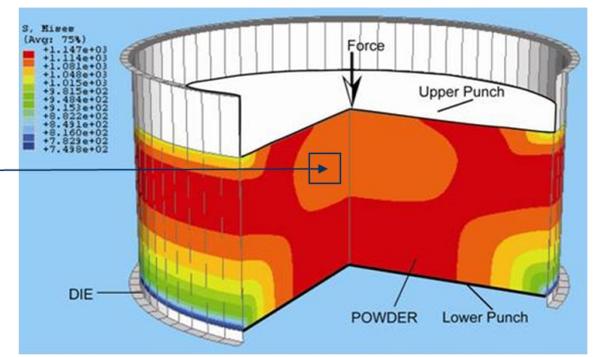

Huxley Bertram Servo-Hydraulic Compaction Simulator

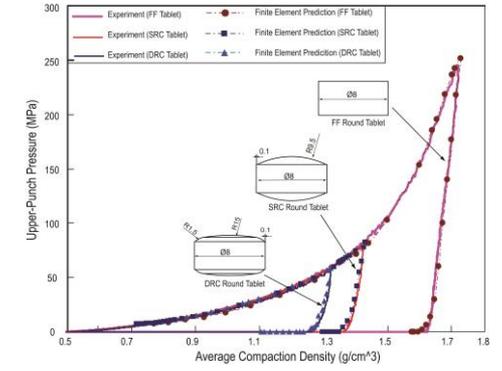

Bulk powder represented by DEM

Density-Dependent Drucker-Prager Cap Plasticity Model

Tablet geometry represented by FEM

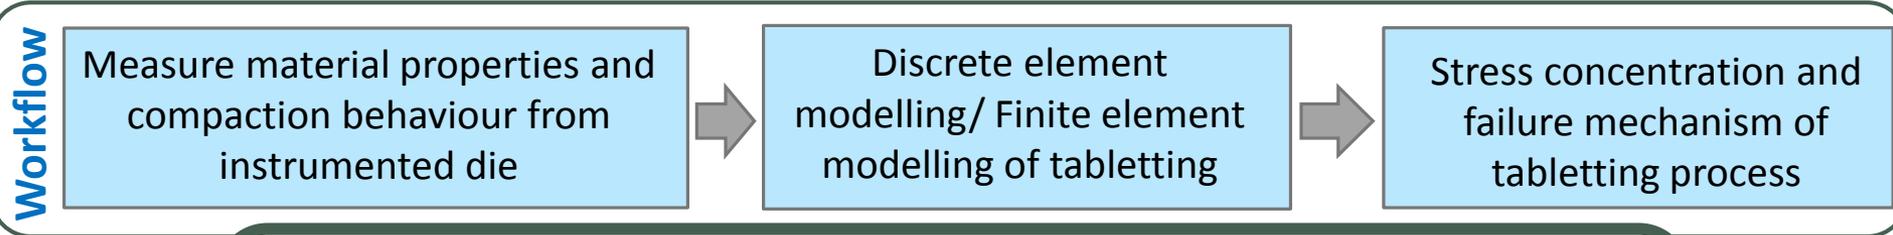

FEM prediction of loading-unloading curves during tableting

Granule Compaction and Tableting Models

WP 4.9: C. Pei, X. Chen and J. Elliott

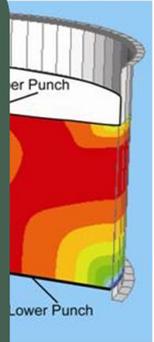

- Aim: to translate data from compaction simulator into FEM/DEM for tablet compaction and understand the ability of both blended and granulated powders to form stable compacts

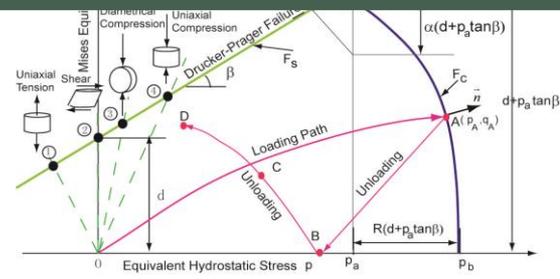

Key Outcomes

- Density dependent and density independent models have been developed and can be used in FEM package
- Models were parametrised with flat face and tested with multiple materials
- Models can be supplied for implemented and used for blends and potentially combine excipients

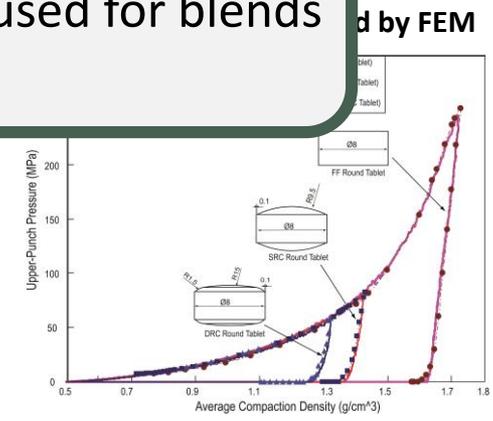

Cylinder Die
Instru

Tablet Coating : Variability and Process Optimization

WP 4.10: C. Pei, X. Chen and J. Elliott

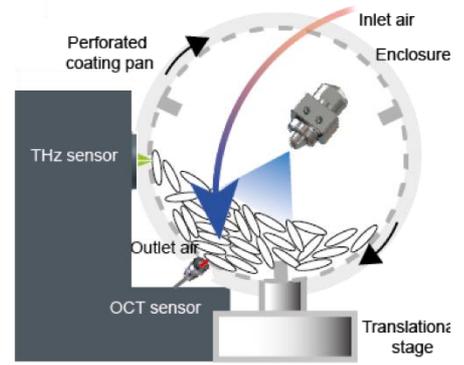

- Aim: to better understand the causes of coating variability and move towards reduced processing times and manufacturing process for spray coating

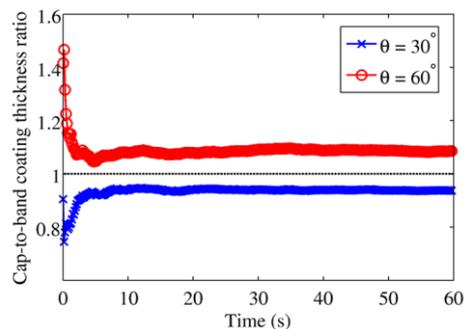

A: tablet flow/ coating uniformity (DEM)

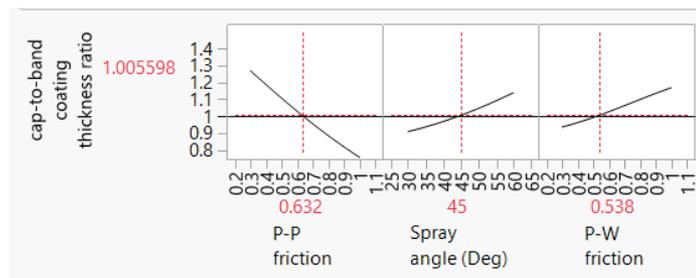

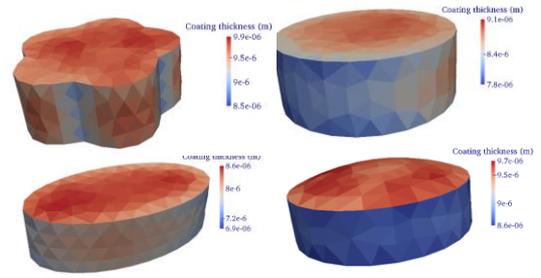

B: spray coating (ray-tracing/image analysis)

C: In-line sensing simulation (ray-tracing)

Inter/intra tablet coating variability prediction

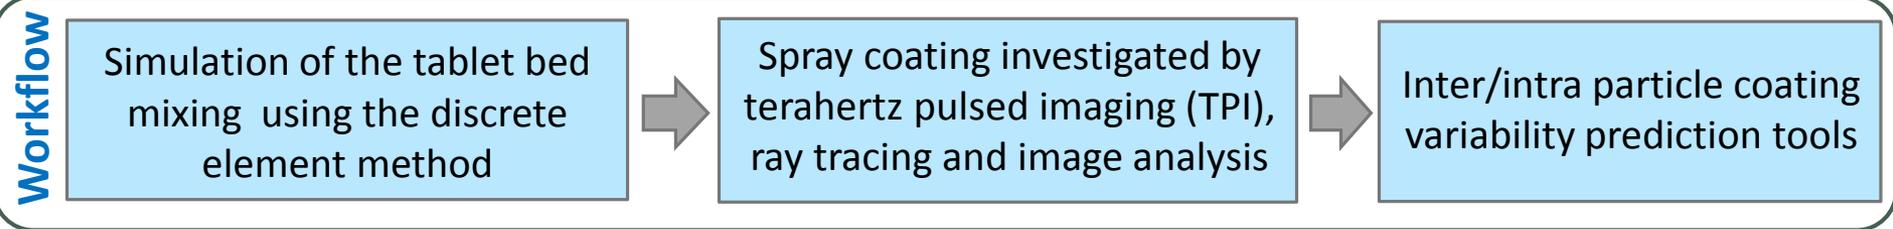

Process optimization tools

Tablet Coating : Variability and Process Optimization

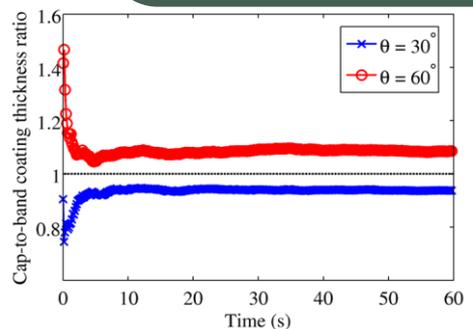

WP 4.10: C. Pei, X. Chen and J. Elliott

- Aim: to better understand the causes of coating variability and move towards reduced processing times and manufacturing process for spray coating

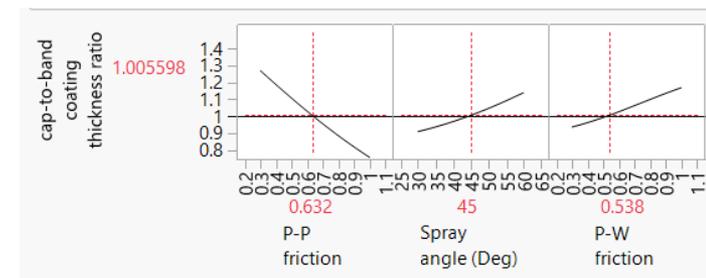

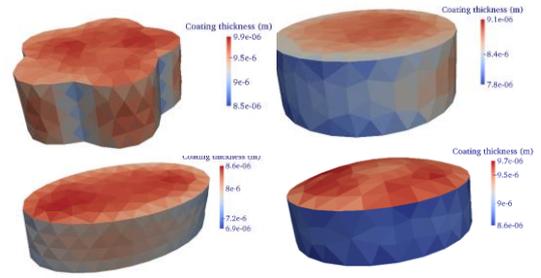

Key Outcomes

- Simulation results were validated with terahertz imaging and in-line measurements for batch coaters
- The effects of tablet shapes, friction, drum fill ratio, spray angle and rotational speed were explored
- Reduced models for tablet coating thickness variability were built for quick process control and optimization

Inter/intra tablet coating variability prediction

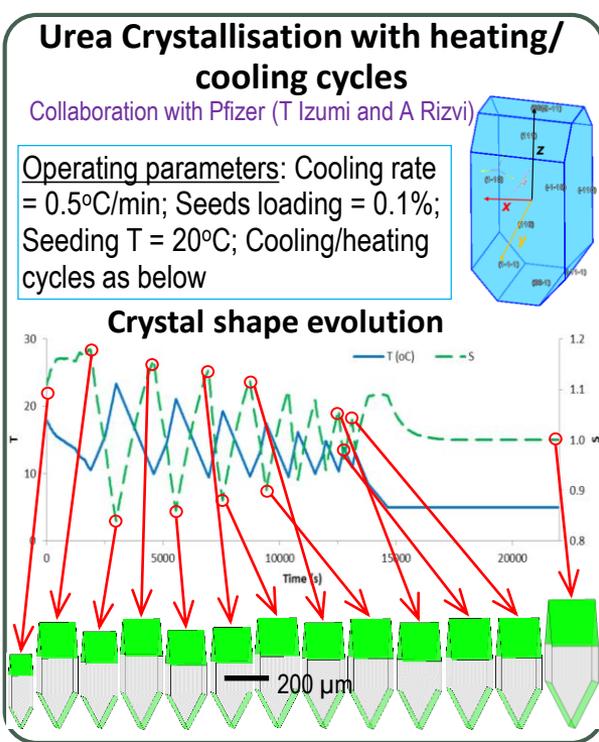

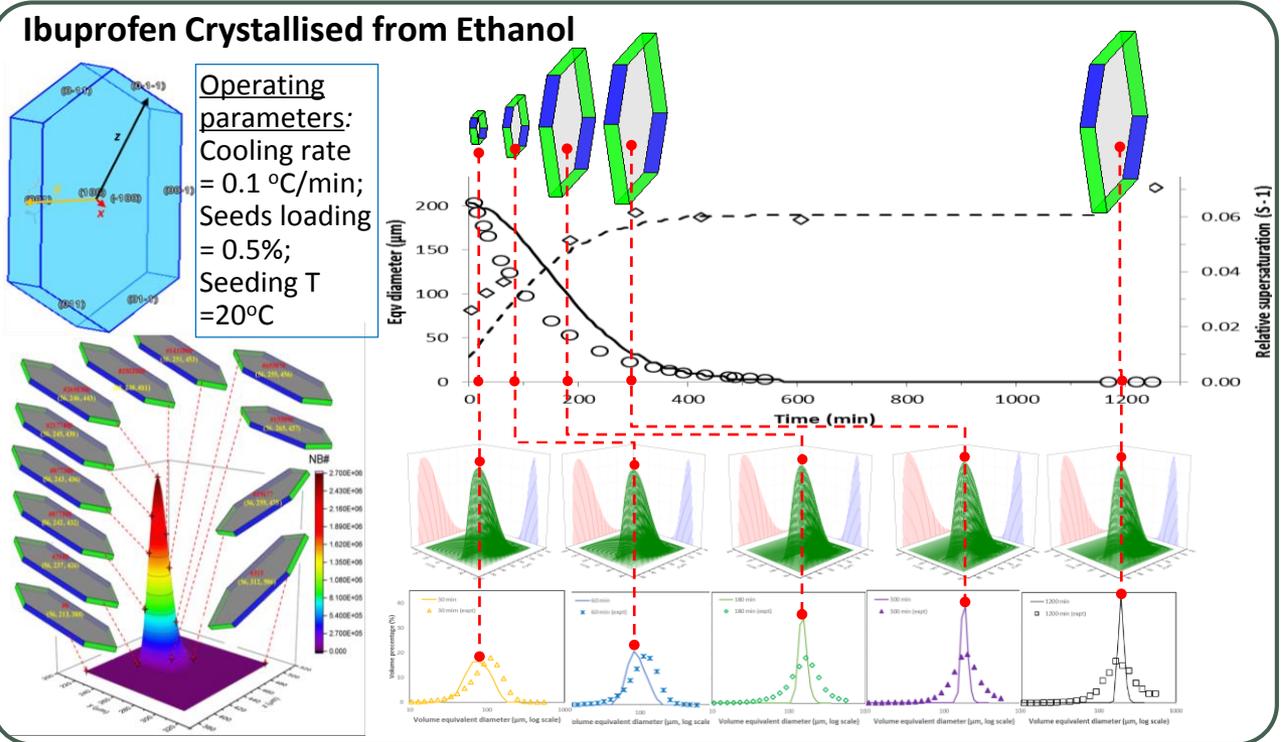

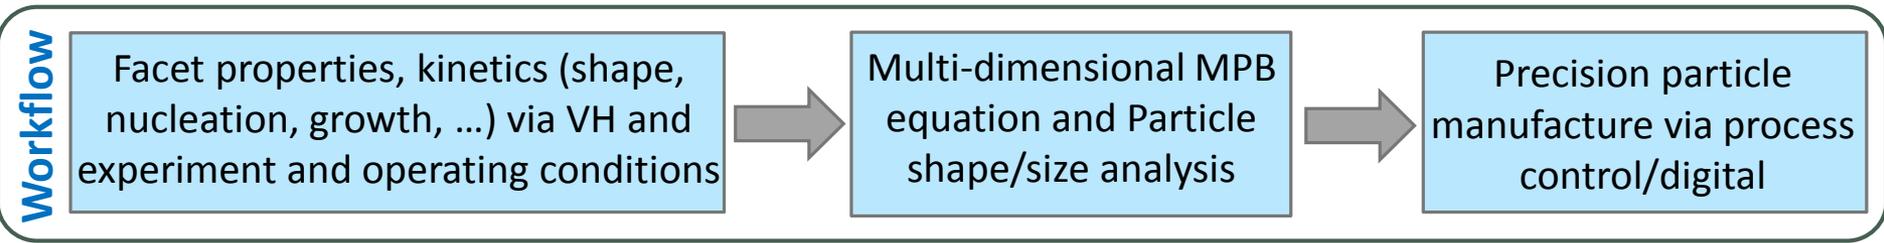

Process optimization tools

Morphological Population Balance (MPB) for Particle Design

WP 4.1/4.2/4.3: C. Y. Ma and K. J. Roberts

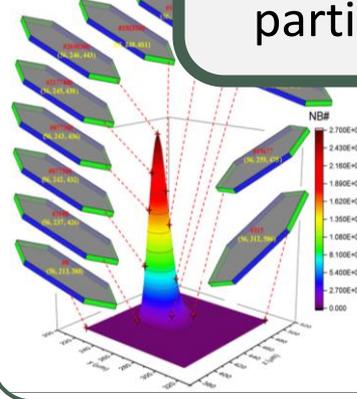

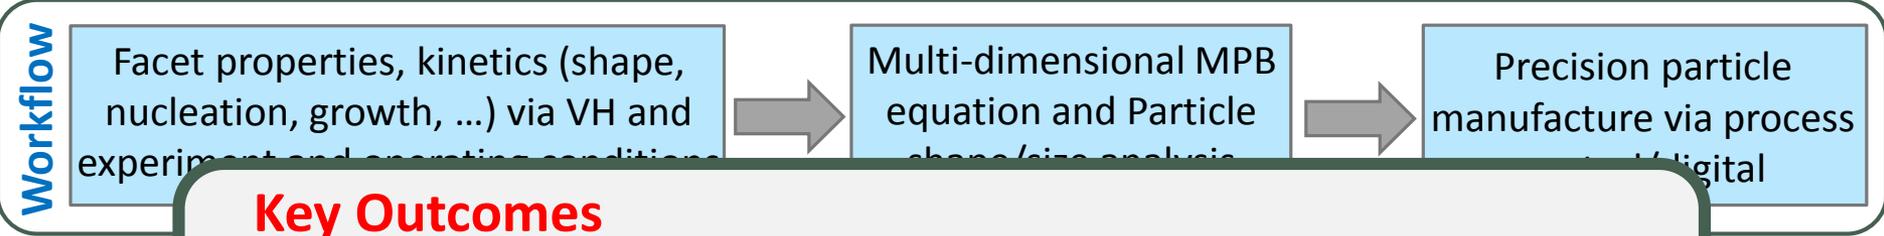

- Integrating facet material properties and process kinetics with MPB modelling for shape/size evolution, process control and digital twins – Precision particles

Morphological Population Balance (MPB) for Particle Design

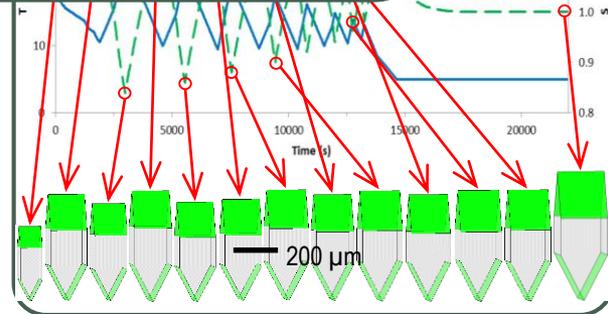

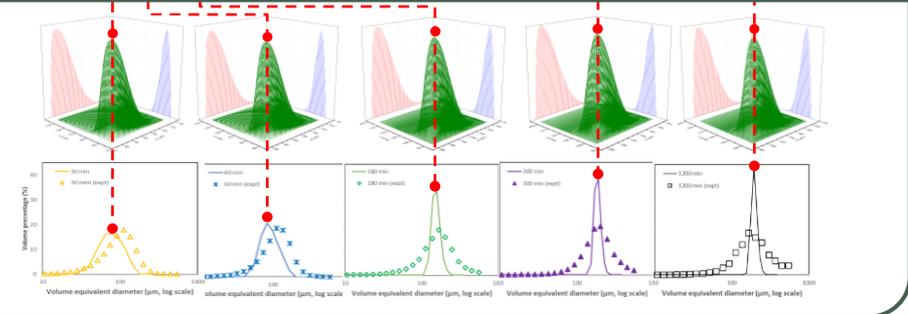

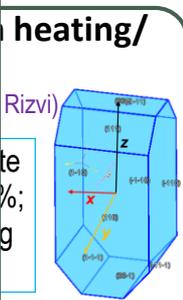

WP 4.1/4.2/4.3: C. Y. Ma and K. J. Roberts

- Integrating facet material properties and process kinetics with MPB modelling for shape/size evolution, process control and digital twins – Precision particles

Key Outcomes

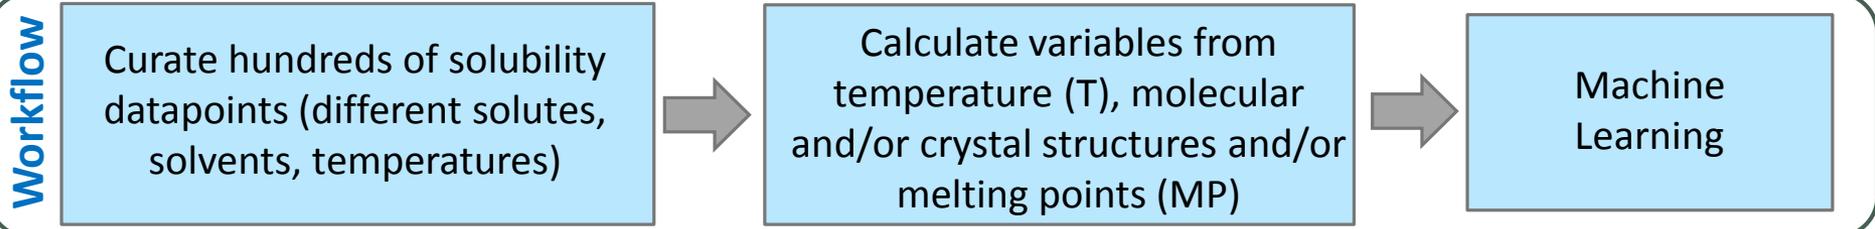

- Morphological population balance (MPB) for predicting crystal size/shape evolution during processing
- Face-based process control/scale-up and experiments lead to 1st principles digital twins for particle design
- MPB enables incorporation into PSEs formulated Products (in particular gCRYSTAL) for process optimisation

Temperature Dependent Solubility: Statistical Models

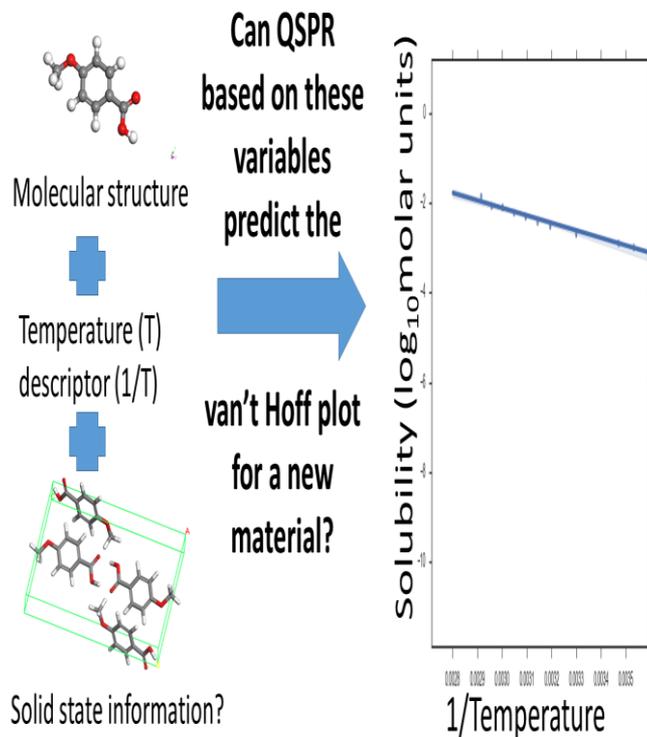

WP 4.2/3.C: R. M. Robinson, E. Martin and K. J. Roberts

- QSPR models of temperature dependent solubility profiles support digital design of cooling crystallization and wet granulation

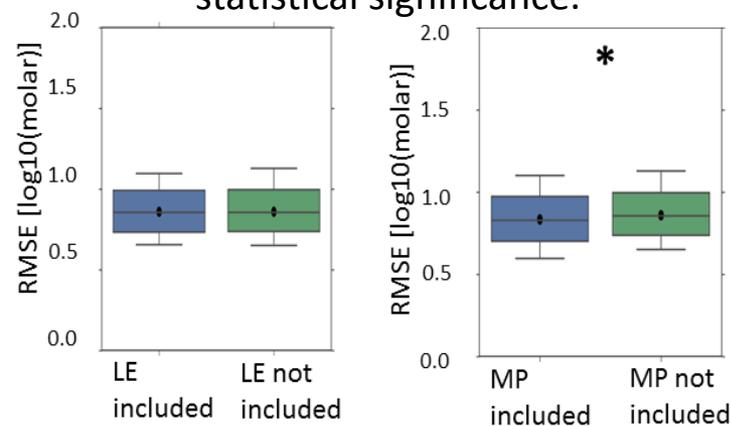

Data curation

- 4,000 solubility values
- 5 – 95 °C
- 400 solutes
- 50 solvents
- MP** for 309 solutes
- Crystal **lattice energies (LE)** calculated for 129 solutes

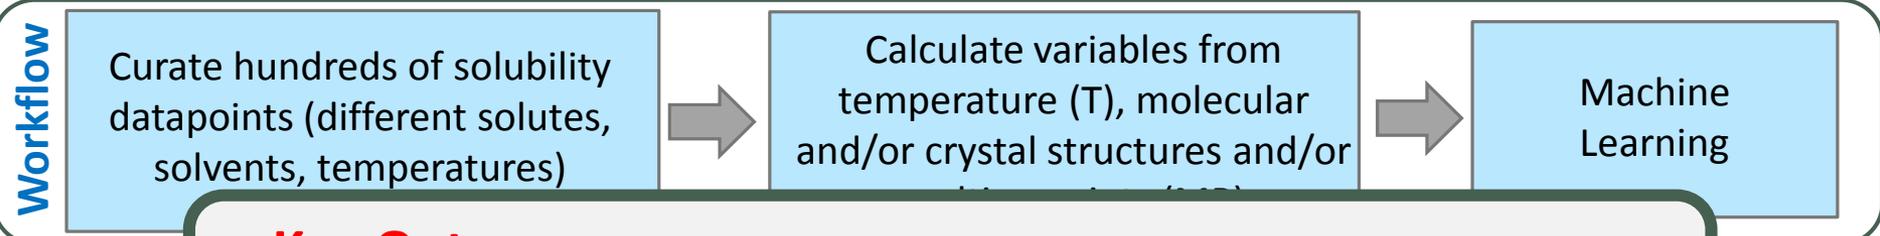

Small change in unbiased validation RMSE (log₁₀molar) values of best aqueous models upon adding lattice energy (LE) or melting point (MP) descriptors. * = statistical significance.

Temperature Dependent Solubility: Statistical Models

WP 4.2/3.C: R. M. Robinson, E. Martin and K. J. Roberts

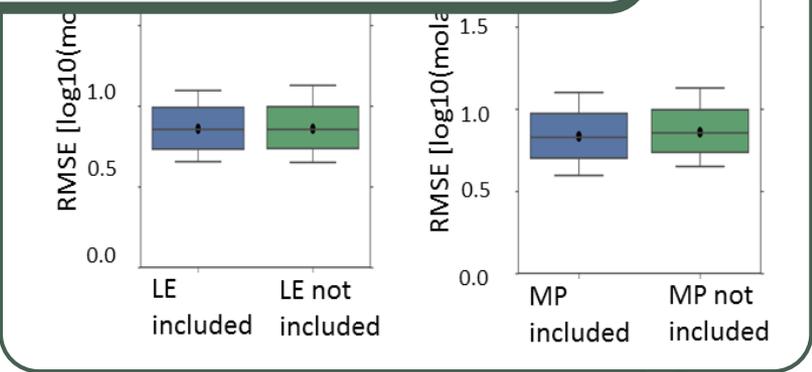

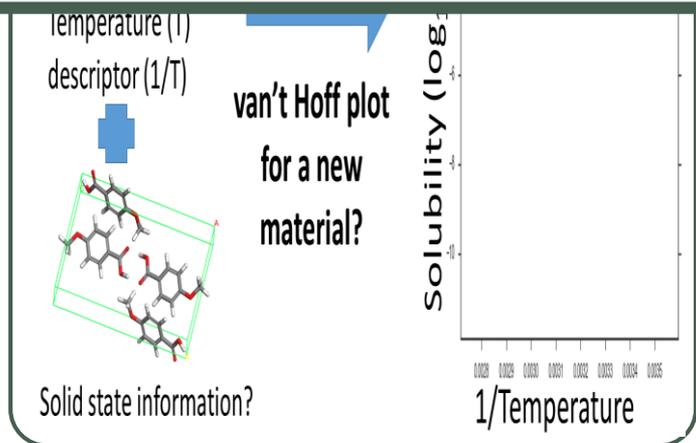

- QSPR models of temperature dependent solubility profiles support digital design of cooling crystallization and wet granulation

Key Outcomes

- Aqueous temperature dependent solubility predicted to within one log unit on average
- Reliable models can be built without solid-state information
- Novel unbiased validation protocol designed

- Data cur**
- 4,000 solubility values
 - 5 – 95
 - 400 so
 - 50 solvents
 - MP** for 309 solutes
 - Crystal **lattice energies (LE)** calculated for 129 solutes

Influence of Conformational Polymorphism on Particle Properties: Ritonavir

Influence of Conformational Polymorphism on Particle Properties: Ritonavir

WP 4/WP 2: Chang Wang, Ian Rosbottom, Thomas Turner and Kevin Roberts

37

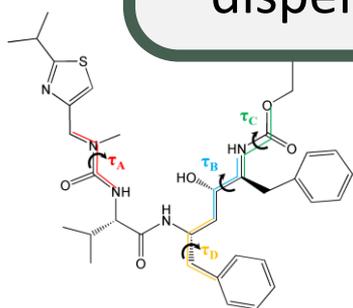

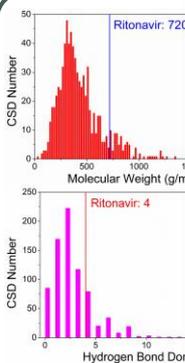

- Relative balance between molecule conformation and lattice energies characterised and related to particle properties

Workflow

Key Outcomes

- Conformation of form I more stable and efficiently packed whereas its lattice energy is much less stable than form II
- Form I has greater contribution from vdW interactions in contrast to form 2 where H-bonding dominates
- Morphology of forms I and II are both needle-like, with dispersive equatorial planes and H-bonded capping faces

Main torsion angles of ritonavir

Polymorphs	Synthon A _{II}		
	Relative Conformational Energy (kcal/mol)	Packing Coefficient	Lattice Energy (kcal/mol)
Form I	0	0.80	-74.48
Form II	5.25	0.74	-92.33

Form I	Energy (kcal/mol)	Interactions
(0 1 1)	25.64	E _{vdW}
(1 0 -1)	70.21	AH-bond, BH-bond, D _{vdW} , E _{vdW}
(1 0 0)	70.07	C _{vdW} , D _{vdW} , E _{vdW}
(1 1 -1)	19.59	AH-bond, D _{vdW}
Total	74.75	
Form II	Energy (kcal/mol)	Interactions
(0 1 1)	70.75	C _{vdW}
(0 0 2)	68.34	B _{vdW} , D _{vdW} , E _{vdW}
(1 0 1)	54.04	AH-bond
(1 1 0)	45.13	AH-bond, C _{vdW}
Total	65.28	

Extrinsic Growth Synthons

Workflow for Controlling Needle-Like Crystals: Lovastatin

WP2/4: T. Turner, L. Hatcher, C. Wilson, K. J. Roberts

38

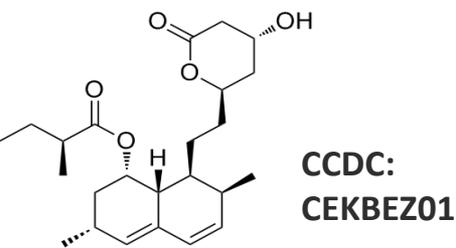

- Synthon based workflow developed to identify key inter-molecular interactions and surface chemistry which lead to the formation of needle-like particles

Workflow

Inter-Molecular Synthon ID and Energetic Characterisation

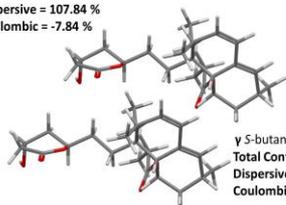

Morphology Prediction and Surface Chemistry ID

Matched Solvent / Additive Chemistry

Synthon A

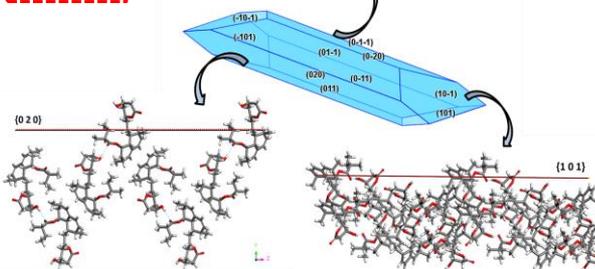

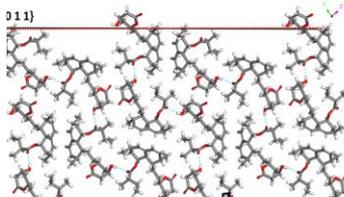

β tetra-hydropyran
Total Contribution: 23.40 %
Dispersive = 107.84 %
Coulombic = -7.84 %

γ 5-butanoate ester
Total Contribution: 21.52 %
Dispersive = 107.25 %
Coulombic = -7.25 %

Dispersive stacking type synthon strongest in lovastatin

Synthon	{0 1 1}	{0 2 0}	{1 0 1}
A (-6.46)	0	0	4
B (-2.98)	2	4	4
C (-2.56)	2	4	2
D (-2.12)	2	4	2
E (-1.96)	2	4	3
F (-1.05)	2	0	2
G (-0.92)	2	0	2
E_{total} / kcal mol ⁻¹	-18.76	-29.32	-41.96

Morphology prediction and visualisation of surface chemistry
Dispersive synthon A contributes positively to growth along needle axis

Matched to dispersive recrystallization solvent; significant reduction in aspect ratio

T.D.Turner, L.E. Hatcher, C.C.Wilson, K.J.Roberts, J. Pharm. Sci. 2018 Dec 24. pii: S0022-3549(18)30811-6. doi: 10.1016/j.xphs.2018.12.012

WP2/4: T. Turner, L. Hatcher, C. Wilson, K. J. Roberts

39

- Synthon based workflow developed to identify key inter-molecular interactions and surface chemistry which lead to the formation of needle-like particles

Workflow

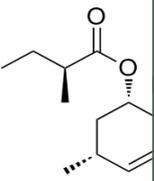

Inter-Molecular Synthon ID and Energetic Characterisation

Morphology Prediction and Surface Chemistry ID

Matched Solvent / Solution Chemistry

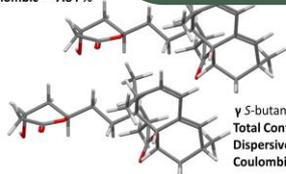

Key Outcomes

- Workflow identifies key inter-molecular interaction/s which may cause needle-like particles
- Problem particle surface chemistry identified and specific synthon contribution to growth quantified
- Directs experimental effort towards suitable solution chemistry to suppress these particular inter-molecular interactions

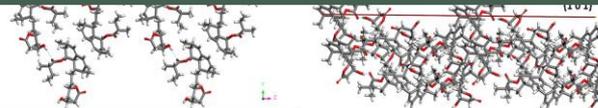

Synthon A

β tetra-hydropyran
Total Contribution: 23.4 %
Dispersive = 107.84 %
Coulombic = -7.84 %

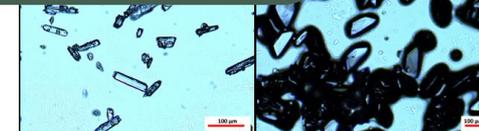

γ 5-butanoate ester

Key Outcomes

- First principles models for particle and process digital design developed
- Digital workflows for product and process R&D developed and tested through industry case studies
- Brief overview given here with further details available through the demonstration and poster presentations
